

# PLURA SELF-ADHESIVE ZERO VAPOUR BARRIER

Technical data sheet

## Description

The bitumen-polymer PLURA SELF-ADHESIVE ZERO V.B. membranes are the arrival point of the latest generation of membranes denominated "composite".

These membranes are thus defined because thanks to a production technology developed in 1995, Pluvitec can produce materials with differentiated waterproofing mass, which allows the optimal use of each layers properties, satisfying the different requirements.

PLURA SELF-ADHESIVE ZERO V.B. are pre-fabricated waterproofing membrane for specific use as a total barrier to the passage of vapour.

PLURA SELF-ADHESIVE ZERO V.B. has a continuous single strand composite woven non woven polyester reinforcement with high mechanical characteristics and an aluminium film which allows to obtain a barrier to the transmission of vapour.

The lower face of PLURA SELF-ADHESIVE V.B. is protected with a removable silicon release film.

The upper face is self protected with micro mineral slates that offer good walkability and improve grip of TECA adhesives (Polyurethane Glue, Pratik Mastic, Bit Adhesive, etc.) for the adhesion of insulating panels; furthermore a removable side selvedge of 10 cm is foreseen.

In the stratigraphy of the roof, PLURA AUTOADESIVO ZERO V.B. must be applied under the insulating panel, in order to preserve the latter from the condensation phenomena of water vapor, which certainly occurs, as the roof operating conditions change.

PLURA SELF-ADHESIVE ZERO V.B. is an innovative self-adhesive with increased adhesiveness, enhanced resistance of the adhesion to aging and the cold (the product maintain good adhesion even at low temperatures). The PLURA SELF-ADHESIVE ZERO V.B. membranes are capable of resolving specific application and functional requirements and present numerous and important advantages, such as ease of application with consequential savings on time and the possibility to apply the material on surfaces which are not suitable to open flame.

Therefore PLURA SELF-ADHESIVE ZERO V.B. is insuperable in the waterproofing of wood structures, insulation panels which are heat sensitive, panel decks and refurbishment of historical roofs.

Furthermore PLURA SELF-ADHESIVE ZERO V.B. can be used and allows the waterproofing of particular roof details (ex. bandaging of plastic tubes, etc.) and the possibility to also apply with the traditional application method of open flame or hot air, obtaining an exceptional level of adhesion.

PLURA SELF-ADHESIVE ZERO V.B. guarantees a perfect level of adhesion to the application surface, providing the system with an excellent level of wind uplift resistance and allowing accidental infiltrations to be traced.

## Stratigraphy

1. Silicon release film
2. Self-adhesive waterproofing compound
3. Compatibility compound
4. Continuous single strand composite woven non woven polyester reinforcement
5. Aluminium film
6. Compatibility compound
7. Self-adhesive waterproofing compound
8. Micro mineral finish
9. Selvedge release film

## Application of the insulation

When choosing the method of fixing the insulation of the roof system, applied on top of the vapour barrier, the following factors must be considered:

- type of insulation (characteristics of stability, compression, etc.),
- compatibility between the fixing, the insulation and the waterproofing membrane,
- type of adhesive,
- the factor of possible wind uplift,
- the type of substrate.

Where application with mechanical fixing is required of the panels, these must be applied side by side making sure that they are also staggered and properly fixed to the PLURA SELF-ADHESIVE ZERO V.B. with suitable fixings to the type of substrate and of the correct length based on the thickness, these should be at least 10 cm from the edges and along the diagonals. The total resistance of the fixing elements of the panel, to wind uplift (Wh), should in any case be superior to  $\geq 400$  N per fixing. For the application of the insulation it is suggested to follow the indications of the manufacturer and eventual indications in the specification.

## Fields of use

### EN13707 Continuous roofs (Certificate n° 0958-CPR-2045/1)

N° layers			Method of application					Type of application			Type					
Single Layer	Double Layer	Multilayer	Torch	Hot Air	Mixed (Torch / Air)	Cold Bond Glue	Mechanical Fixing	Thermo Adhesive / Self-Adhesive	Fully Bonded	Partially Bonded	Loose Laid	Complimentary Layer	Top Layer	Heavy Protection	Anti-root	Other Uses

PLURA SELF-ADHESIVE ZERO V.B. PA 2.5 KG/M<sup>2</sup>

### EN13970 Vapour barrier

PLURA SELF-ADHESIVE ZERO V.B. PA 2.5 KG/M<sup>2</sup>

The waterproofing membrane based on distilled bitumen and polymers, as shown in this data sheet does not require the issue of a MSDS, because it does not contain dangerous substances. The information data sheet for the proper use of products is available.

## PLURA SELF-ADHESIVE ZERO V.B.

### Application

- On cementitious surfaces and similar apply, by roller or airless, synthetic primer PRIMER SINT, approx. consumption 200-400 g/m<sup>2</sup>. This application is not required on wooden roofs except OSB boards.
- Position the PLURA SELF-ADHESIVE ZERO V.B. on the application surface; provide side & head laps respectively of 10 & 15 cm's between the sheets. (Draw. N.1)
- Remove the release film from the lower face, this is divided longitudinally in two sections, in one or two steps, making sure to also remove the side selvage of the upper surface. It is always suggested to mechanically fix head & side laps. (Draw. N.2-3)
- Use suitable roller by applying pressure over all of the membrane surface, particularly the side & head laps to further promote adhesion.
- Position the thermal element as described in technical specifications (adhesives or mechanical fixing, etc.) (Draw. N.4-5)

### Recommendations

- The PLURA SELF-ADHESIVE ZERO V.B. membranes are to be applied on dry clean surfaces which must be treated with a synthetic primer PRIMER SINT, excluded are wooden roofs except OSB boards.
- Self-adhesive membranes must not be applied on sanded or talced underlays. The granulometry of these upper surfaces creates a detaching effect that prevents the self-adhering properties from achieving a fully bonded installation.
- The side & head laps must be respectively of 10 & 15 cm's.
- When applying on verticals, the apex of the membrane must be mechanically fixed with a proper flashing; where possible it is advisable to go up and over the vertical and on to the horizontal surface.

- Avoid storing the product on the roof with temperatures lower than +10°C or higher than +40°C if not for the time necessary for installation.
- With temperatures below +10°C it is necessary to apply the product using particular precautions:

- Store the rolls in an upright position in the original packaging, indoors and in dry and warm areas.
- Transport the rolls to the place of application only at the time of use.
- The ideal application occurs at temperatures above +10°C, however it is possible to apply the product below +5°C bringing the rolls to the ideal temperature with a leister or gas torch.

- The application surface must not have any depressions to avoid the risk of ponding water, the slope must be at least 1.5% on concrete decks and 3% for steel or wooden ones, this to guarantee a proper run off of rainwater.**

- Program periodical roof inspections to remove debris, mud, plants, etc. and to keep under control the waterproofing as well as accessory details (drain outlets, TV antennas, air conditioning, etc.).

- In the eventuality in which the element to be waterproofed presents residual humidity (ex. refurbishment, application after heavy rains) it is necessary to foresee the use of air vents, which will be positioned in a way to allow for the evacuation of the humidity.

- Absolutely avoid the stacking of rolls and pallets for storage or transport to avoid possible deformations which may compromise a perfect installation. It is recommended to store the product at temperatures above 0°C.

For further information and news we recommend to consult Pluvitec technical literature; our Technical service is always available to study particular problems and to offer the necessary assistance for optimal use of our waterproofing membranes.

### Technical data

Technical Characteristics	Measure Units	Reference Norm	PA	Tolerance
Type of reinforcement			Single strand polyester + Aluminium film	
Upper face finish			Micro mineral *	
Lower face finish			Silicon release film

\* Mineral self-protected products may undergo color tone variations due to the time and length of storage. Exposure to atmospheric conditions, after application, will tend to uniform the color after a few months. The change in color tone cannot therefore be contested and / or complained of as it is a natural phenomenon that the slate manufacturer himself cannot guarantee.

### Sizes & packing

	PA 2,5 kg/m <sup>2</sup>
Rolls size [m]	15x1
Rolls per pallet	25
Square meters per pallet [m <sup>2</sup> ]	375

Sizes & packing may vary depending on the type of transportation. The technical data given is based on average values obtained during production. We reserve the rights to change or modify the nominal values without prior notice or advice. The information contained in this data sheet are based on our experience. We cannot take any responsibility for a possible incorrect use of the products. The customer has to choose under their own responsibility a product fit for the intended use.
